EDUCATION

Université de Montréal

Computer Science (B.Sc.)

Montréal, QC

Graduation: May 2026

EXPERIENCE

Software Analyst and Developer Intern

CAE Inc.

March 2026 – April 2026

Montreal, QC

- Built and shipped a virtual reality flight training simulator on an Agile team at a global aerospace company, so trainees could rehearse cockpit procedures without booking a real aircraft.
- Developed the application in C# and .NET inside Unity with the Meta XR SDK, calling a REST API for real-time voice so a user could operate the simulator by speaking instead of hunting for a control.
- Worked in Git and GitHub with AI-assisted tools (GitHub Copilot, Claude Code), presented the project to the team and wrote the technical documentation, revising it on senior feedback.

Security Analyst

Canada Revenue Agency (CRA)

July 2024 – June 2025

Ottawa, ON

- Acted as the daily gatekeeper for who could access software and data at a federal agency, reviewing about 30 requests a day to protect systems holding private information on millions of Canadians.
- Classified the sensitivity of each request against an internal security framework and granted, redirected or escalated it to senior analysts with written findings, keeping permissions at the minimum a person needed.

Tutor

MonsieurMath

October 2023 – June 2025

Montréal, QC

- Taught math to more than 20 students, breaking each problem into plain steps until the student could solve it alone, with an average score above 80%.
- Tracked each student's progress in Excel and rewrote the learning plan when a method was not working, instead of repeating an explanation that had already failed.

PROJECTS

Community Project Platform | [Next.js](#), [React](#), [TypeScript](#), [Tailwind CSS](#), [Prisma](#), [PostgreSQL](#), [Vercel](#)[Github](#) | [Site](#)

- Built a site that runs community projects the way open source runs software, with public task boards and credited contributors so anyone can see what needs doing and who did it.
- Modelled projects, contributors and tasks in PostgreSQL through Prisma, and built the interface in Next.js, React and TypeScript with next-intl translations on Vercel, so French and English communities share one board.

Collaborative Whiteboard | [Next.js](#), [React](#), [JavaScript](#), [HTML](#), [CSS](#), [Clerk](#), [Liveblocks](#), [Convex](#) [Github](#) | [Site](#)

- Built a whiteboard where several people draw on the same board at once and every change appears instantly for everyone, so a remote team can sketch an idea together instead of trading screenshots.
- Built the interface in Next.js, React, JavaScript, HTML and CSS, with Clerk handling sign-in and Liveblocks and Convex keeping the boards in sync, so someone who joins late sees the same board as everyone else.

AI Search Visibility Audit | [Next.js](#), [React](#), [TypeScript](#), [Node.js](#), [Tailwind CSS](#), [Firecrawl](#), [Google GenAI](#)[Github](#) | [Site](#)

- Built a web app that checks whether AI assistants name a business when a customer asks them for a recommendation, so an owner can see whether they are being left out.
- Wrote the Node.js server routes that call the Google GenAI and Firecrawl APIs, rank the 50 real companies a query returns and hand back a JSON list of copy-paste fixes a web developer can apply.

Automated Testing Pipeline | [Java](#), [Maven](#), [GitHub Actions](#), [CI/CD](#), [Git](#)

[Github](#)

- Built an automated system that tests code every time it changes, catching bugs before they ship.
- Used Java, Maven, and GitHub Actions to build a CI/CD pipeline that runs unit and integration tests on every push, keeping the main branch stable.
